Instagram: time spent and audience profile

Name: Rajkumar Naredla | Student number: 26001545

This report examines Instagram time spent in 52 countries and territories and its global age profile using published tables in *Digital 2025* [1]. Usage estimates cover active Android-app users in November 2024; demographic shares come from the report's early-2025 advertising data. Country labels were matched, hours converted to minutes, and the worldwide row excluded from market statistics. No market rows were missing or duplicated.

1. Bar chart: monthly time spent by market

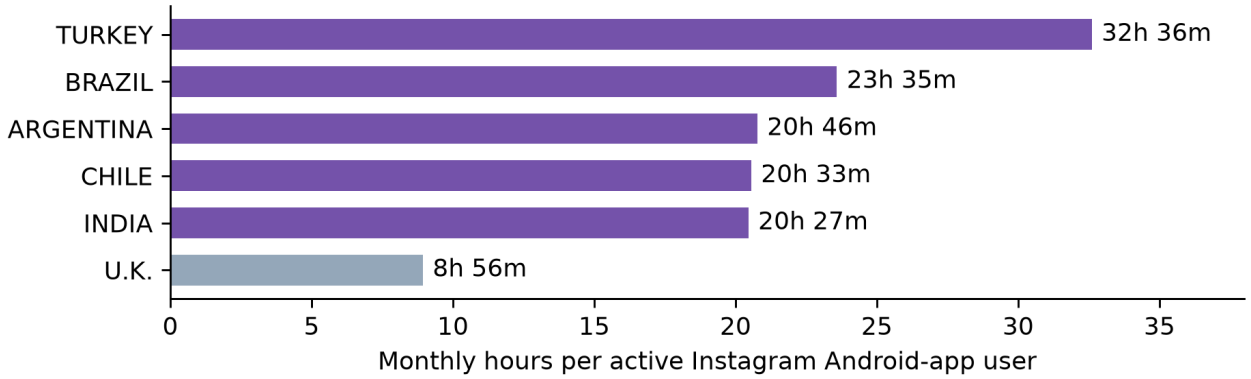

Figure 1. Top five markets, with the UK added for comparison. Turkey led the 52 reported markets at 32h 36m per user, followed by Brazil at 23h 35m. India ranked fifth at 20h 27m; the UK recorded 8h 56m. Across all markets, the mean was 11.72 hours, the median 10.24 and the standard deviation 5.11. The larger mean reflects the upper tail. These unweighted market statistics are not global user averages.

2. Pie chart: age composition of the audience

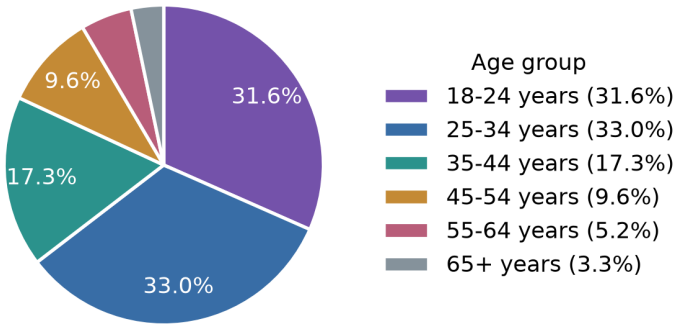

Figure 2. Female and male shares were added within each age group. Ages 25-34 formed the largest share (33.0%), just above ages 18-24 (31.6%). Together they accounted for 64.6%. Ages 65+ contributed 3.3%. These are shares of the reported advertising audience, not minutes spent or the percentage of each age group using Instagram. The figures cannot identify which age group spends the longest on the app.

3. Line plot: age profiles by reported gender

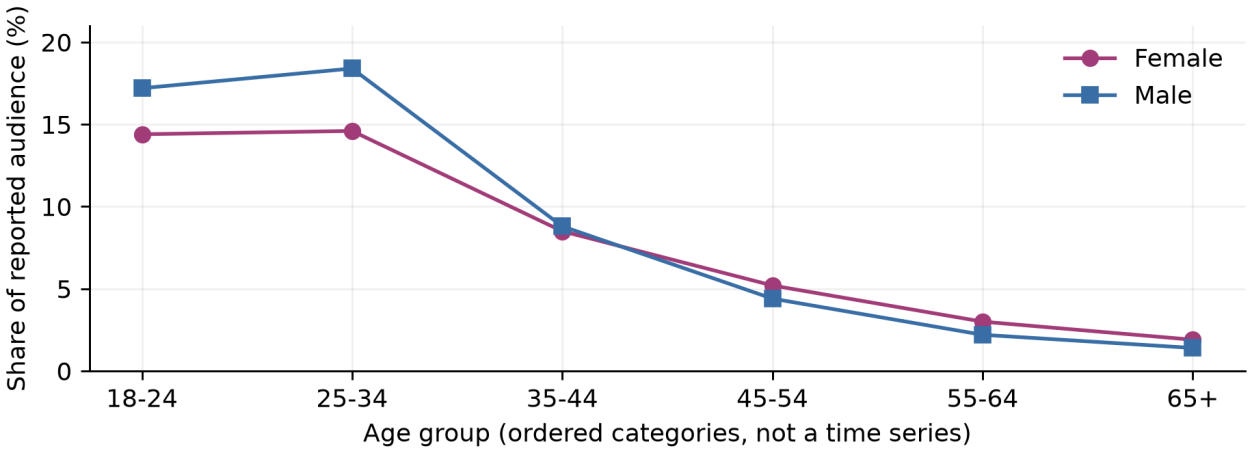

Figure 3. Both profiles peaked at ages 25-34: 18.4% for men and 14.6% for women. The male share was larger in the three younger groups, while the female share was larger from age 45 onwards. Summed shares were 52.4% male and 47.6% female. Lines connect ordered age categories only; they do not represent change over time, equal age intervals or measured values between groups.

4. Heatmap: app openings and monthly time

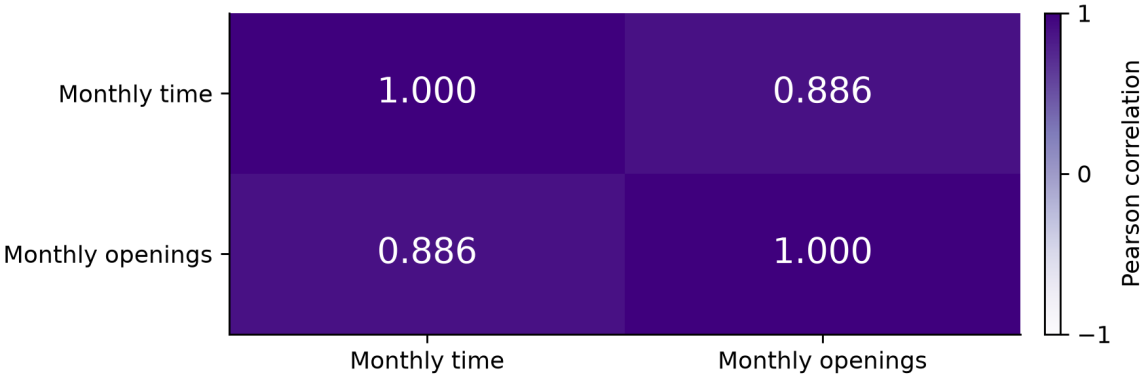

Figure 4. Across the 52 markets, monthly openings and monthly time had a strong positive Pearson correlation (r = 0.886). The diagonal values are 1 because each measure is compared with itself. Total time depends partly on opening frequency and session duration, so the association is unsurprising. Country-level averages do not establish individual behaviour or causation.

Conclusion and limitations

Turkey had the highest average time in the listed markets, and ages 25-34 formed the largest reported audience group. Usage excludes iPhone and browser activity. Advertising reach is not identical to active users, and reported ages may be inaccurate. Only female/male demographic categories were available; under-18 gender splits were absent. The time and demographic tables cover different periods and populations, so they were analysed separately. Results describe a historical snapshot, not current global rankings.
