Instagram: time spent and audience profile

Name: Rajkumar Naredla **Student number:26001545**

This report looks at Instagram time spent in 52 countries and territories and its global age profile using the published tables from *Digital 2025* [1]. The usage figures are for active Android app users in November 2024 and the demographic shares are from the early 2025 advertising data. Country labels have been matched, hours have been converted to minutes and the global row has been omitted from the market data. There were no missing or duplicate market rows.

1. Bar chart: monthly time spent by market

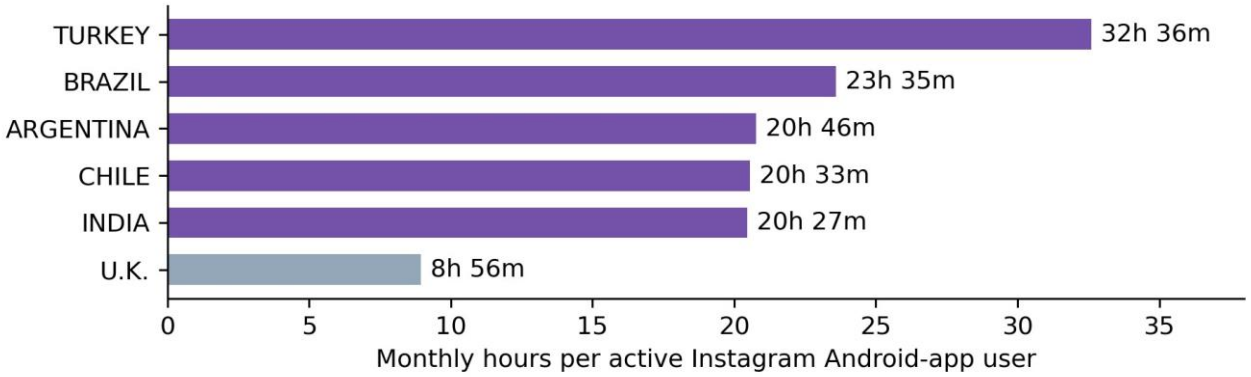

Figure 1. Top 5 markets (with UK added for comparison). Turkey came top of the 52 markets at 32h 36m per user, Brazil was second at 23h 35m, India fifth at 20h 27m and the UK at 8h 56m. The global mean was 11.72hrs, median 10.24hrs and standard deviation 5.11hrs. The higher mean is due to the upper tail. These are the unweighted market figures and not global user averages.

2. Pie chart: age composition of the audience

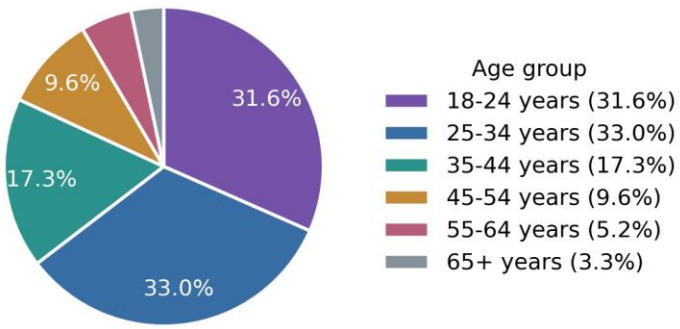

Figure 2. The female and male shares were added in each age group. Ages 25-34 were the largest share (33.0%) followed by ages 18-24 (31.6%). Together they made up 64.6%. Ages 65+ were 3.3%. These are shares of the reported advertising audience (not minutes spent or the % of each age group using Instagram). The figures don't tell you which age group is spending the most time on the app. Statistics and trends | Historical Instagram data 1/2

3. Line plot: age profiles by reported gender

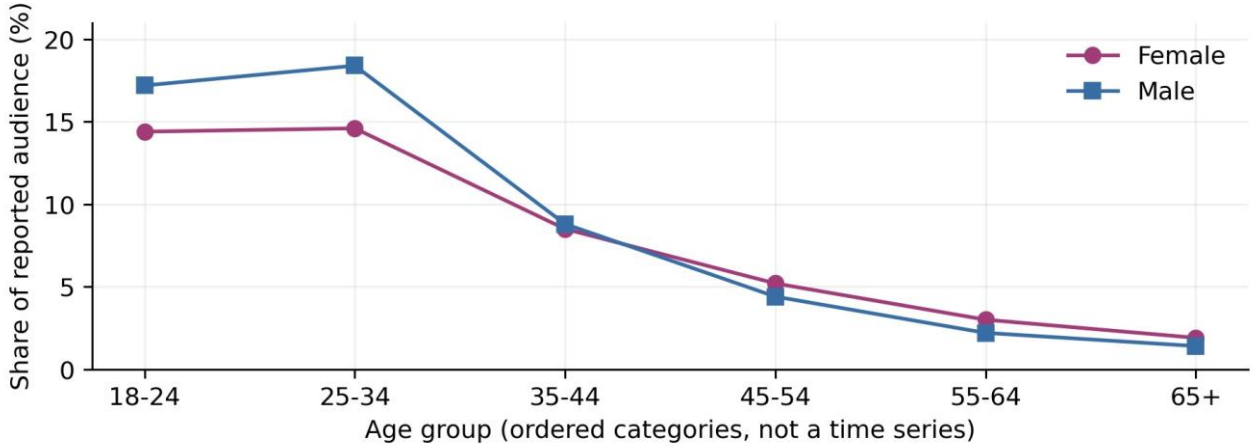

Figure 3. Both profiles peak in the 25-34 age group (18.4% male, 14.6% female). The male proportion is higher in the younger groups and the female proportion is higher from age 45 onwards. The total male share is 52.4%, female 47.6%. The lines simply join the ordered age groups, they don't represent change over time, equal age intervals or actual measured values between the groups.

4. Heatmap: app openings and monthly time

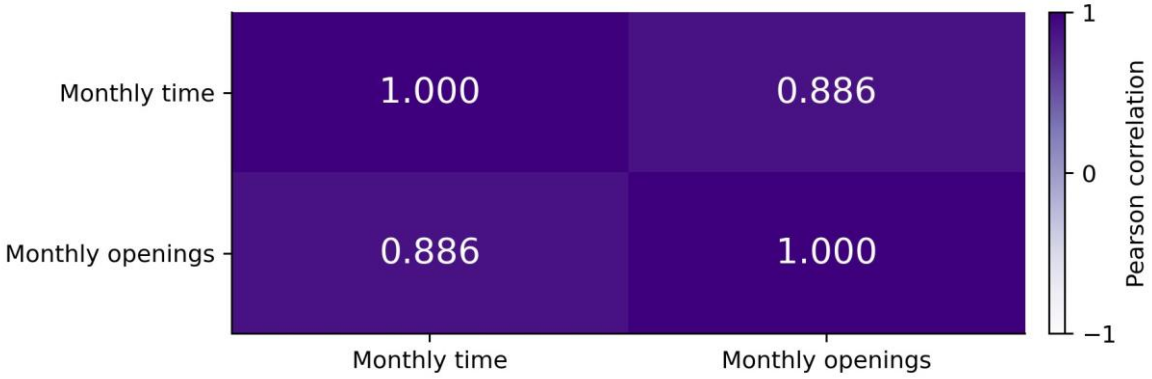

Figure 4. Across the 52 markets there was a very strong positive Pearson correlation between monthly openings and monthly time (r = 0.886). The diagonal values are all 1 as you'd expect when you're looking at a variable against itself. Total time obviously in part depends on both the frequency of openings and the length of the session so the correlation is not surprising at all. The country level averages don't tell you anything about individual behaviour or about causality.

Conclusion and limitations

Turkey had the highest average time of any of the markets listed and the 25-34 age group was by far the largest audience group reported. Usage excludes iPhone and browser usage. Advertising reach is not the same as active users and the reported ages may be wrong. Only the male/female demographic categories were available (no under 18 gender splits). The time and demographic tables cover different periods and different populations so they were looked at separately. The results are a historical snapshot and not current global rankings.
